

Comparison Table of Space Networks and Satellites

Version of 15 March 2012

L.Perek, Czech Space Office

The Table lists “notified space networks” and “active satellites” at orbital positions in the geostationary orbit. All notified space networks operating at the same orbital positions are contained within horizontal lines. “Notified” means space networks in non-planned services¹ which have been announced to and coordinated by procedures of the International Telecommunication Union and published in dated editions of the online ITU Space Network List (www.itu.int/ITU-R/space/sn/). These networks enjoy international recognition and protection against harmful interference. Following columns show the administration (country or its part – Adm), the organization operating the network (Ntwk Org) and the Space Network Name. That last item appears in ITU documents as “Sat_Name” but in fact it refers to the Space Network Name (i.e. item in a document), not to a Satellite (spacecraft, vehicle in space).

The right-hand part of the Table lists satellites located in the geostationary orbit at, or close to, the nominal orbital position. The first column gives the COSPAR international designator (year of launch, serial number of launch in that year, and serial letter of the object). The designator identifies the satellite in a unique way and for its lifetime. The following column gives the name, or one of the names, of the satellite. The last but one column shows the observed longitude (East, West) at the date, month and year, in the last column. That information comes from the US Space Surveillance Network. It is published in the Two Line Elements, www.ghrs.msfc.nasa.gov/orbit/tleformat.html. Processed values appear in the Encyclopedia of Satellites and Probes of the Czech Academy of Sciences, author A. Vítek at www.lib.cas.cz/space40.

Orbital positions of some satellites not published in the Two Line Elements have been observed by the International Scientific Optical Network (Keldysh Institute of Applied Mathematics Moscow) and published in Table 2 of the 14th issue of the Classification of Geosynchronous Objects, ESA-ESOC, Darmstadt. That issue became available only after the end of the 49th session of the Scientific and Technical Subcommittee and could not have been included in the document A/AC.105/C.1/2012/CRP.25. These positions are denoted „Jan2012“.

No entry in the right-hand side of the Table means that no satellite was at that position and consequently the space networks at the left-hand side had no means of radio transmissions.

¹ A few additional space networks appear in the broadcasting satellite services. These have not been included here in order to keep the table concise.

Comparison Table of Space Networks and Satellites

Version of 23 May 2012
