

GEO Satellites from Two Line Elements in a short time period

Cyril Ron and Luboš Perek

Astronomical Institute

Czech Academy of Sciences

4 June 2012

ron@ig.cas.cz, perek@ig.cas.cz

Diagrams of daily paths of GEO satellites are presented as seen on the equator. The paths are centered at epochs of the NORAD Two Line Elements (TLE) taken from the web page Celestrak (administered by T.S. Kelso)¹ with epochs between May 3 and May 11, 2012. The time span between two points of a path is 1.2 hours. At the highest or lowest point of each orbit, wherever appropriate and to avoid overlaps, the abbreviated COSPAR international designator identifies the satellite. The diagrams were made in program MATLAB by students of the West Bohemian University, Pilsen, Czech Republic, in the tutorial of Space Geodesy.

The TLE contain active satellites as well as some drifting objects and satellites in libration orbits around the Eastern, 75E or Western, 105W (or -105 in the diagrams), stable point. The 12 diagrams are ordered in geographic longitude. An accompanying table gives a comparison with the situation at the beginning of the year 2012 in order to show the major as well as minor changes which occurred within a span of four months. The first column gives the nominal position of the relevant space radio networks, the second gives the name, or one of the names, of the satellite, the third column shows the full COSPAR international designator, the fourth column shows the longitude of a satellite as it was at the end of 2011. The last column contains remarks or alternative names of satellites.

The position of a fully controlled satellite appears as a small disc, such as 07007B at about 6E on the first diagram "0 to 30". Satellites with only small changes in position show extended discs or ovals, such as 00019A at 15E. Large

¹ <http://www.celestrak.com/NORAD/elements/geo.txt>, on May 11, 2012

“figures-eight” show satellites in inclined orbits, such as 90021A, Intelsat 603, inclination 8.08° . A daily “figure-eight” orbit is marked by 20 small black discs and several dots in-between. A satellite with a non-negligible eccentricity and inclination may show an oval, such as 02011A, TDRS 9, at 41W on page “-60 to -30”. A drifting satellite shows an open path, such as 94047A, DIRECTV 2, on pages “-90 to -60” and “-60 to -30”.

The actual density of objects in the GEO is larger than that shown in the diagrams because the 800 debris and other objects are without published TLE. A relatively large number of “figure-eight” objects appear around the two stable points at 75E and 105W while over the Pacific, at 170W to 150W, is an empty quarter. Remarkable is also the regular spacing of satellites in the Eastern Pacific between 140W and 120W.

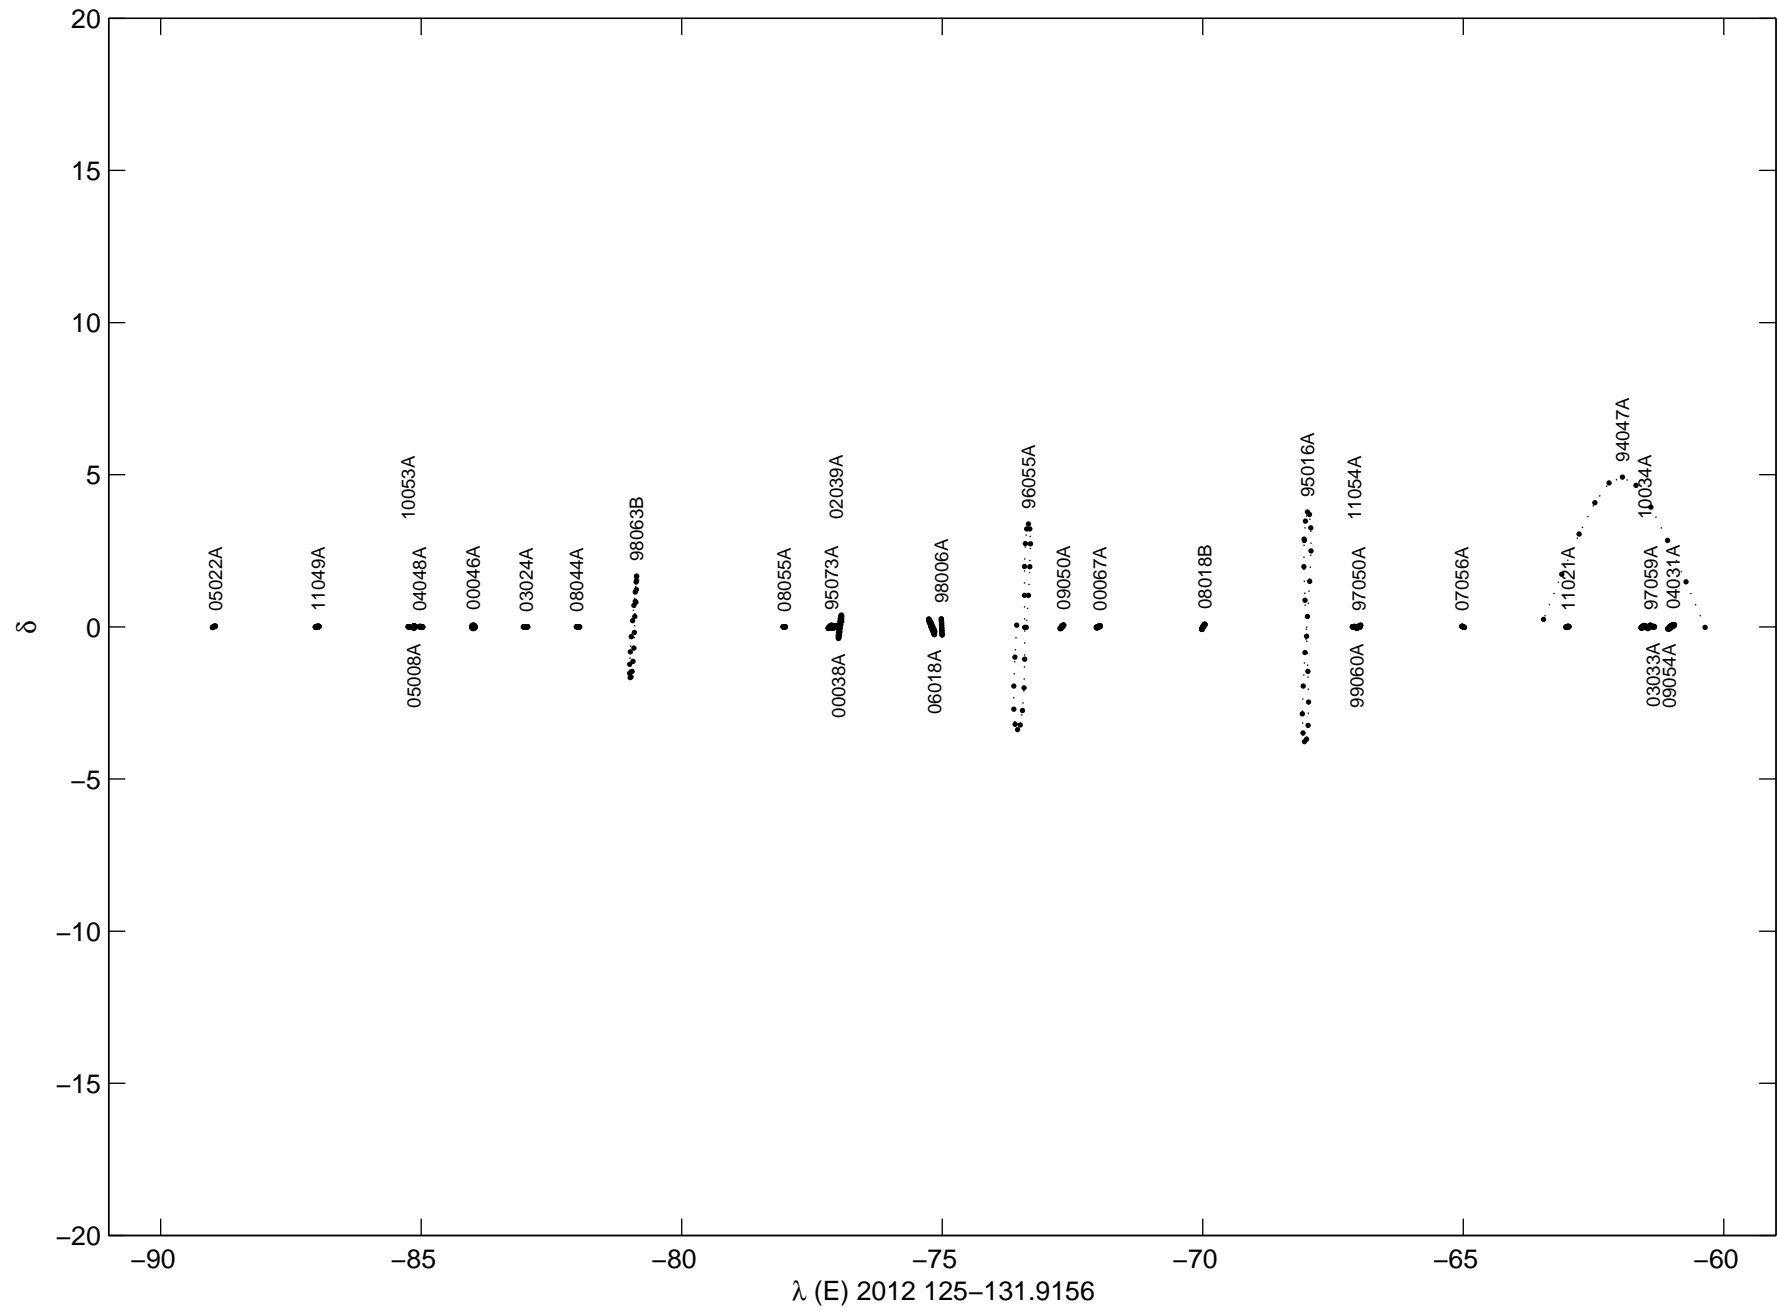

Satellites with TLE from 2012, days 125 to 131

Version of 1 June 20121
